

Abstract of the Disclosure

A visual device placed on a water ski that enables easy detection of the ski in various water and weather conditions. The reflective red flag attaches to a flexible, metal-coated spring. The flag is balanced by a 40/50 carbon counterweight. The metal-coated spring, in turn, attaches to a C-shaped polyethylene base with a rotator secured to it with a 1/4-20 machine bolt. The polyethylene base attaches to the water ski by industrial strength Velcro. In use, the device is compliant, and bends easily out of the way so as not to interfere with the performance of the water ski. When not in use, the device springs back into a vertical position, the flag is upright to allow visual detection of the ski.
